

Abstract

An actuator device adapted to move an object. The actuator device includes a motor connectable with a power source and a rotatable member coupled to the motor for rotation about a central axis. The actuator device also includes a swivel arm positioned on the

5 rotatable member for rotation about the central axis relative to the rotatable member. The swivel arm receives movement from a driving portion of the rotatable member. Further, the actuator device includes a cable coupling the swivel arm with the object, whereby the object is movable in response to movement of the swivel arm.
